Primary

- ReactJS
- Nextjs
- TailwindCSS
- Bootstrap
- Redux

Secondary

- ExpressJS
- MongoDB
- GSAP
- ThreeJS
- AWS

📁 PROJECTS

ClupChat

Bridge the gap between messaging platforms
Developed a web-based communication platform that enables users from different messaging services (e.g., WhatsApp and Telegram) to chat seamlessly without installing each other's apps. The system acts as a bridge, allowing messages sent from Telegram to be received on WhatsApp and vice versa

Go Brick by Brick

Build your language skills, one step at a time
Designed and developed a language learning web app with two core learning flows: **Go Audio** for immersive audio-based learning, and **Go Quiz** for interactive quizzes. Users can create personal notes, set custom quizzes, and track progress through features like streak tracking, daily engagement, and quiz-based performance results. The platform also supports background audio playback, allowing users to listen to course material without keeping the screen active.

ChatDB

Smart assistant with structured output and routine automation
Initially built as a clone of LibreChat, ChatDB evolved into a custom AI chatbot platform tailored to client needs. Enhanced the UI and implemented features like generating structured tables based on user-chatbot interactions, automating daily activity creation, and scheduling routine actions to reduce user workload and improve efficiency.
